## Reference Counting And Cycles

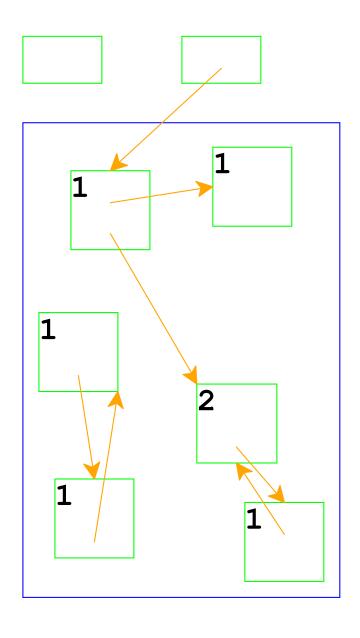

An assignment can create a cycle...

## Reference Counting And Cycles

Adding a reference increments a count

#### Reference Counting And Cycles

Lower-left records are inaccessible, but not deallocated

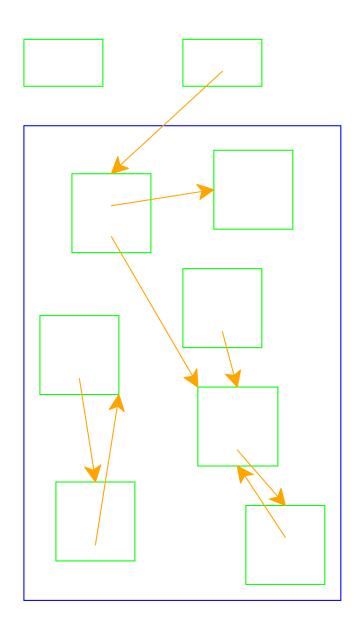

In general, cycles break reference counting

**Garbage collection:** a way to know whether a record is *accessible* 

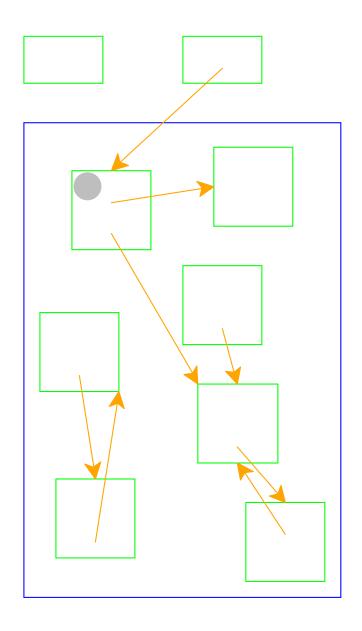

- A record referenced by a register is live
- A record referenced by a live record is also live
- A program can only possibly use live records, because there is no way to get to other records
- A garbage collector frees all records that are not live
- Allocate until we run out of memory, then run a garbage collector to get more space

#### Garbage Collection Algorithm

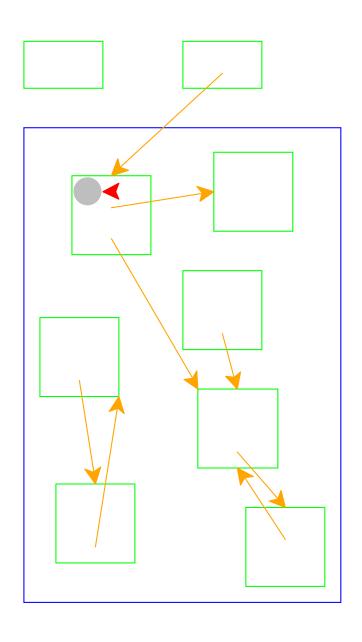

- Color all records white
- Color records referenced by registers gray
- Repeat until there are no gray records:
  - Pick a gray record, r
  - For each white record that r points to, make it gray
  - Color r black
- Deallocate all white records

All records are marked white

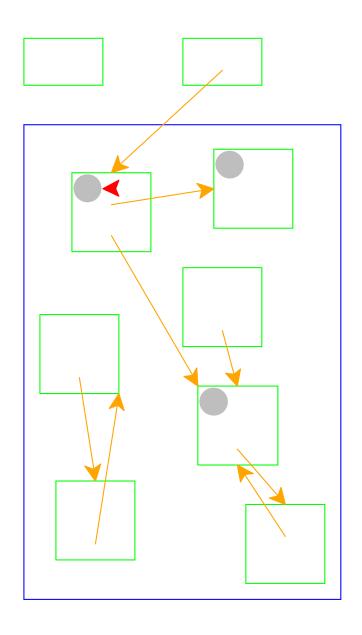

Mark records referenced by registers as gray

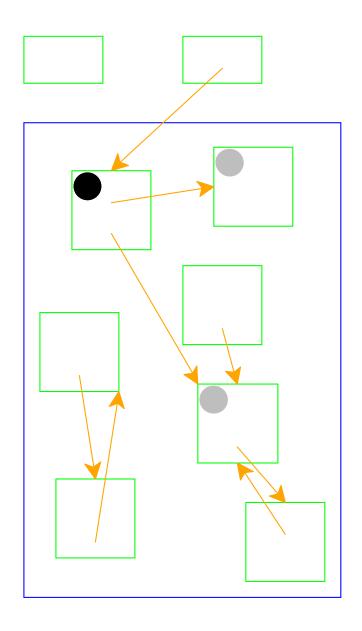

Need to pick a gray record

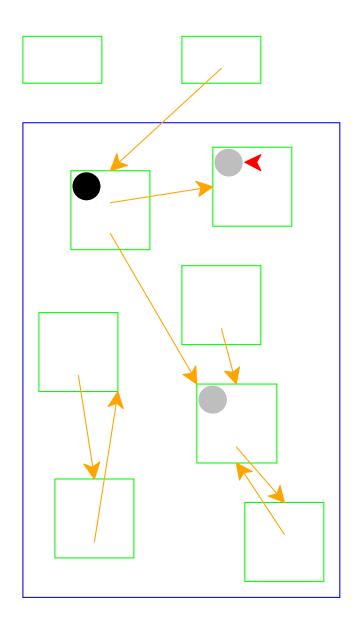

Red arrow indicates the chosen record

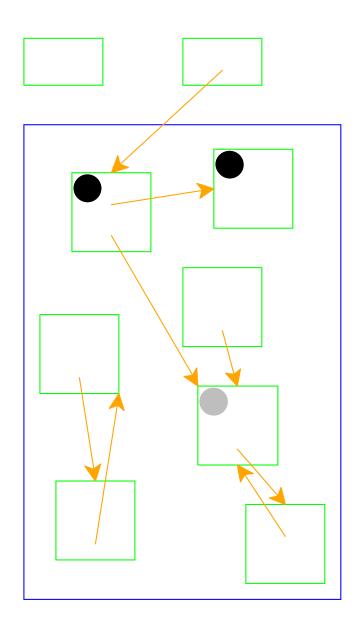

Mark white records referenced by chosen record as gray

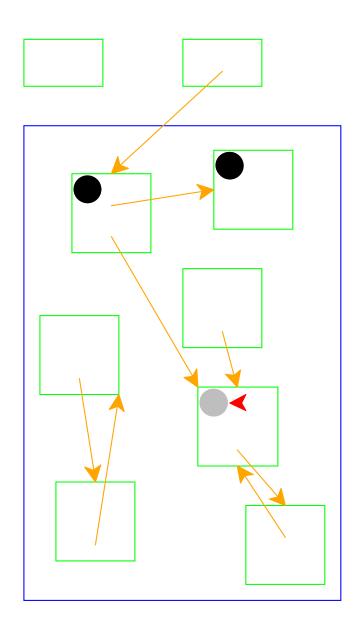

Mark chosen record black

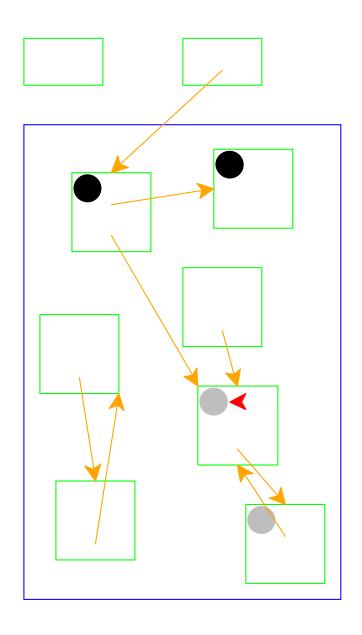

Start again: pick a gray record

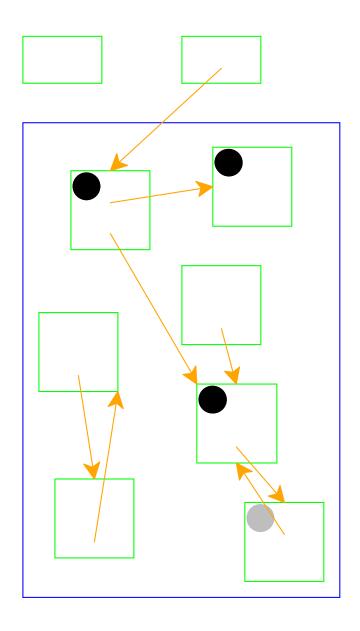

No referenced records; mark black

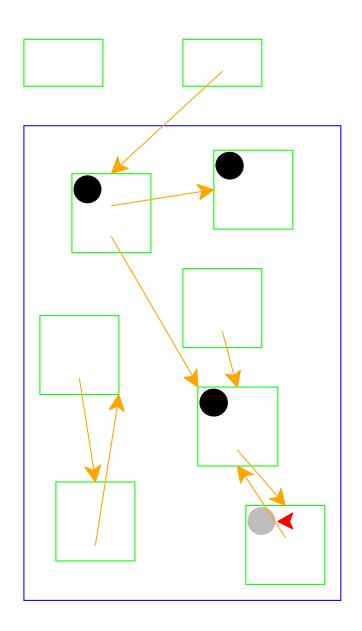

Start again: pick a gray record

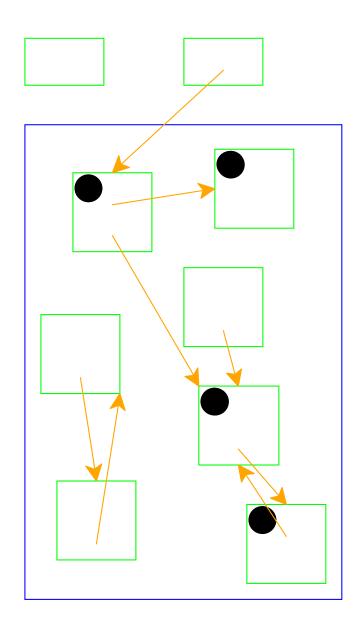

Mark white records referenced by chosen record as gray

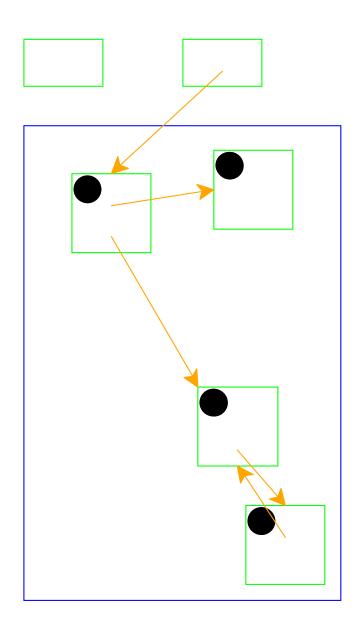

Mark chosen record black

Start again: pick a gray record

No referenced white records; mark black

No more gray records; deallocate white records

Cycles **do not** break garbage collection

#### Two-Space Copying Collectors

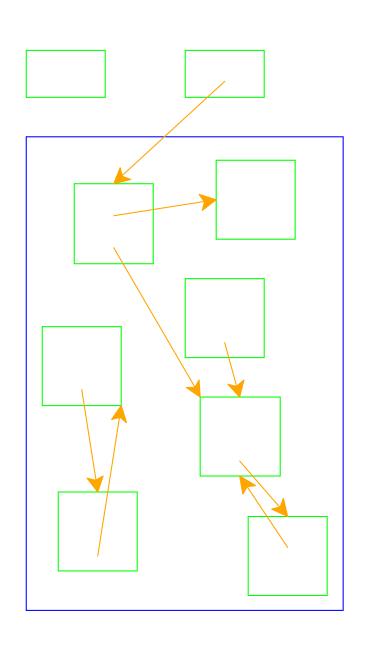

A **two-space** copying collector compacts memory as it collects, making allocation easier.

#### **Allocator:**

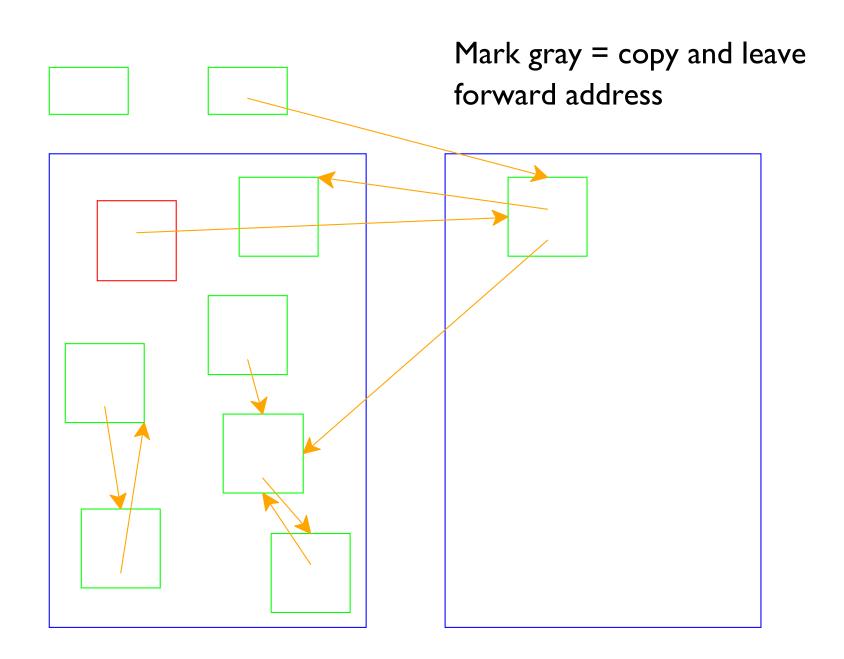

- Partitions memory into to-space and from-space
- Allocates only in to-space

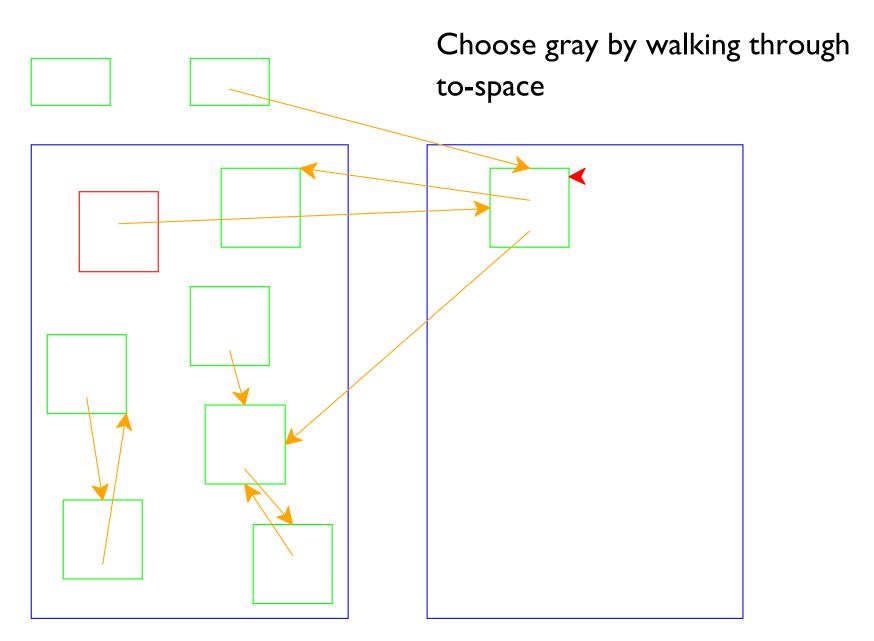

#### **Collector:**

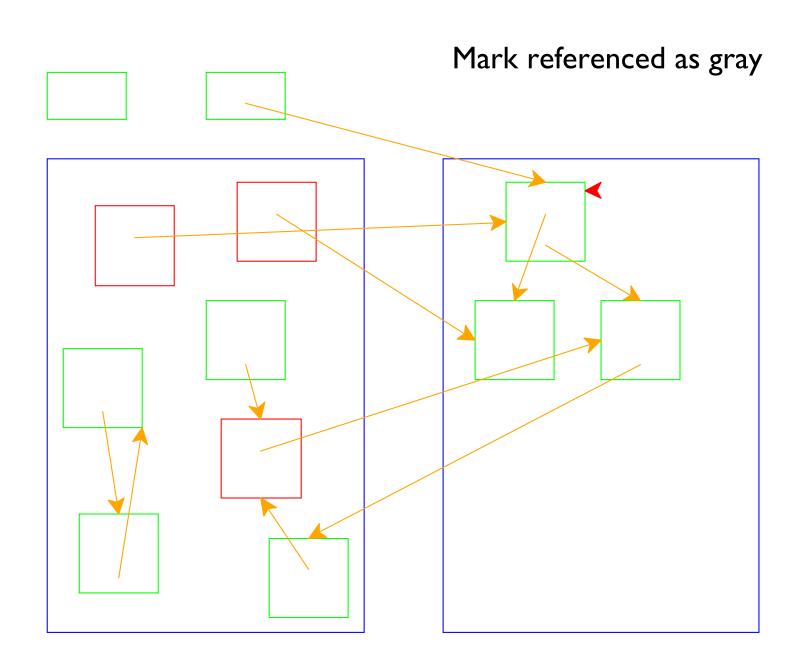

- Starts by swapping to-space and from-space
- Coloring gray ⇒ copy from from-space to to-space
- Choosing a gray record ⇒ walk once though the new
   to-space, update pointers

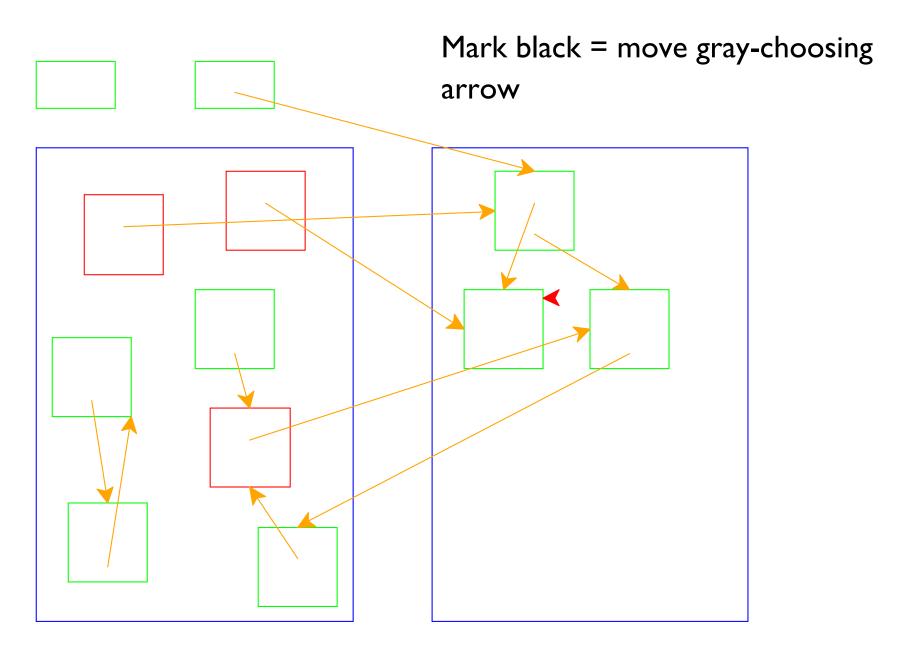

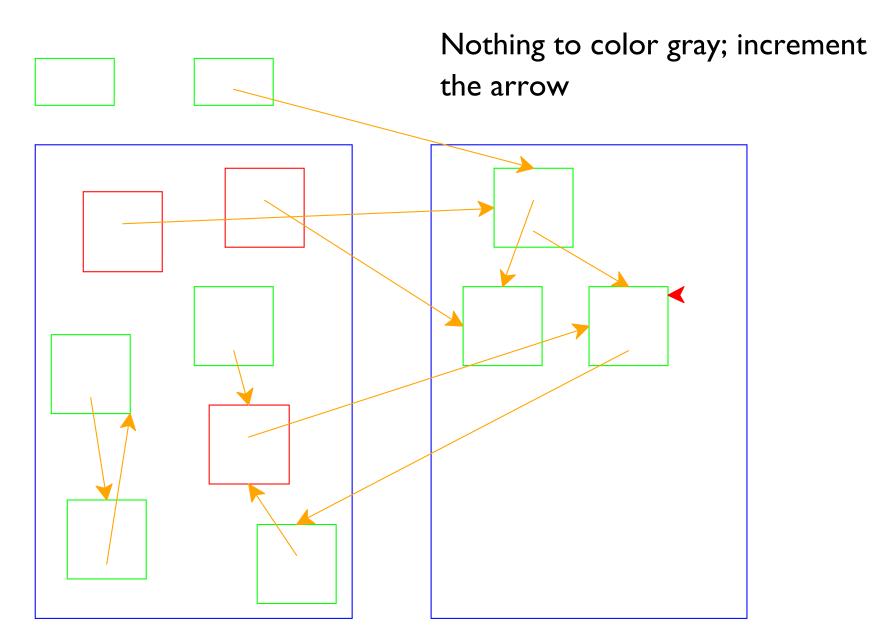

Left = from-space Right = to-space

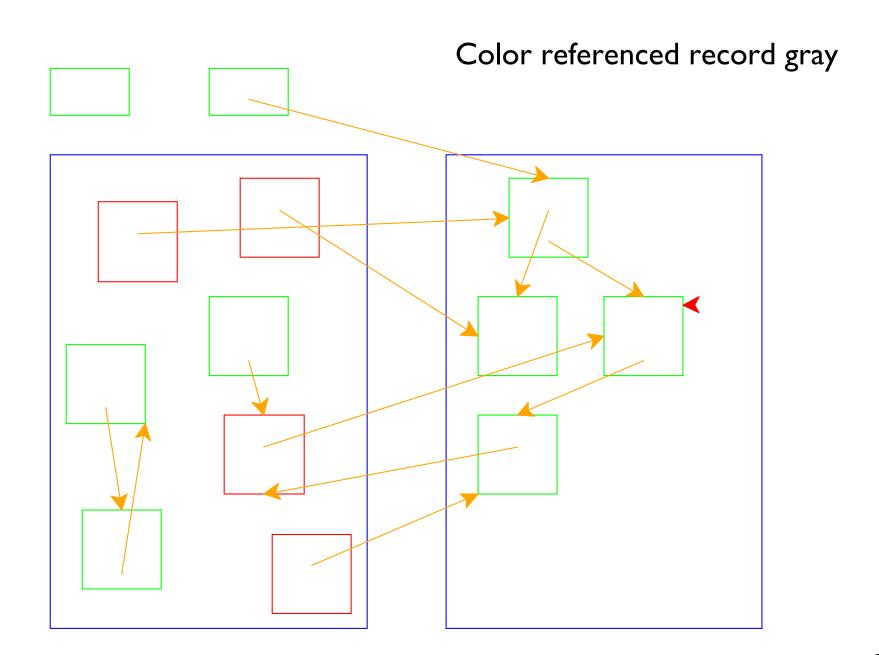

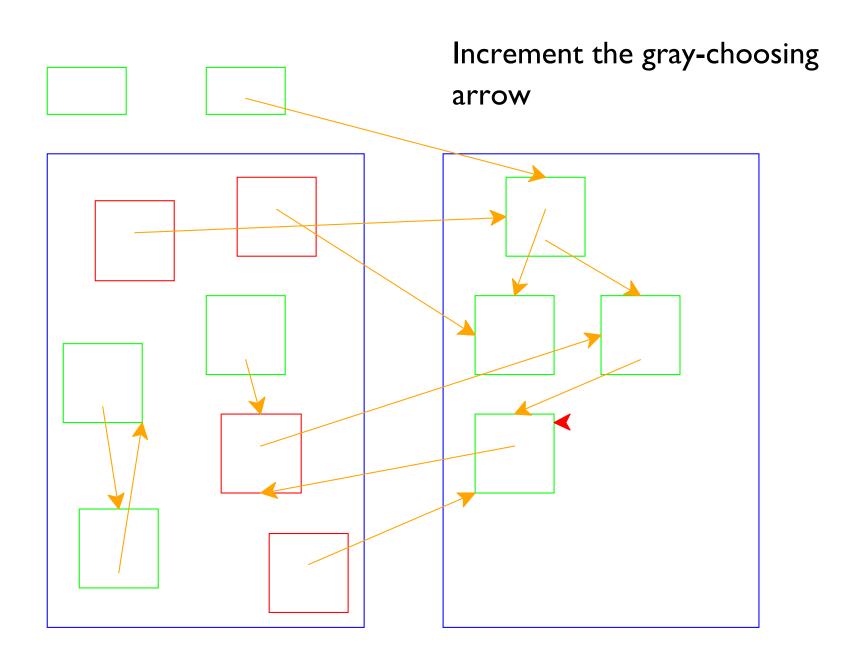

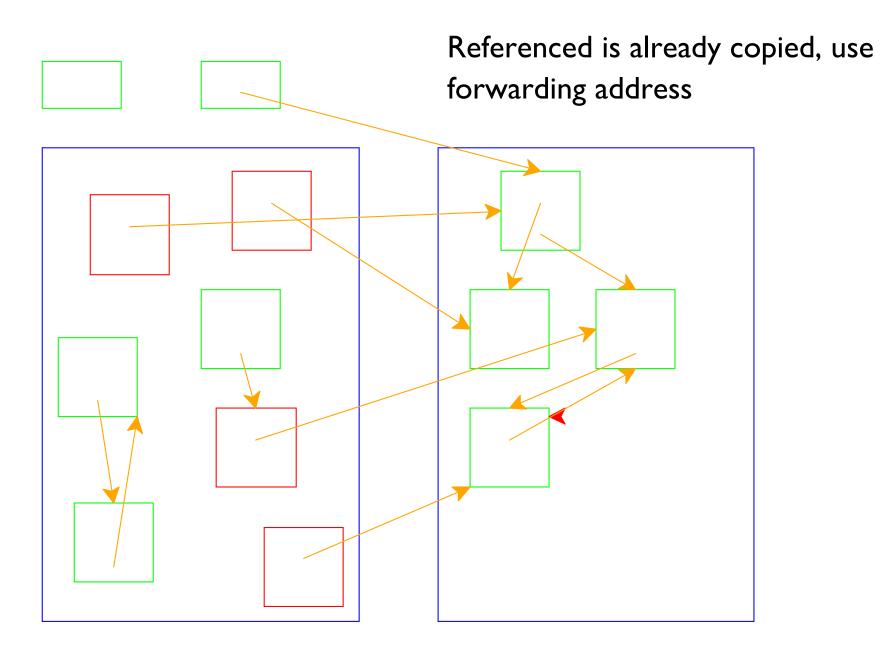

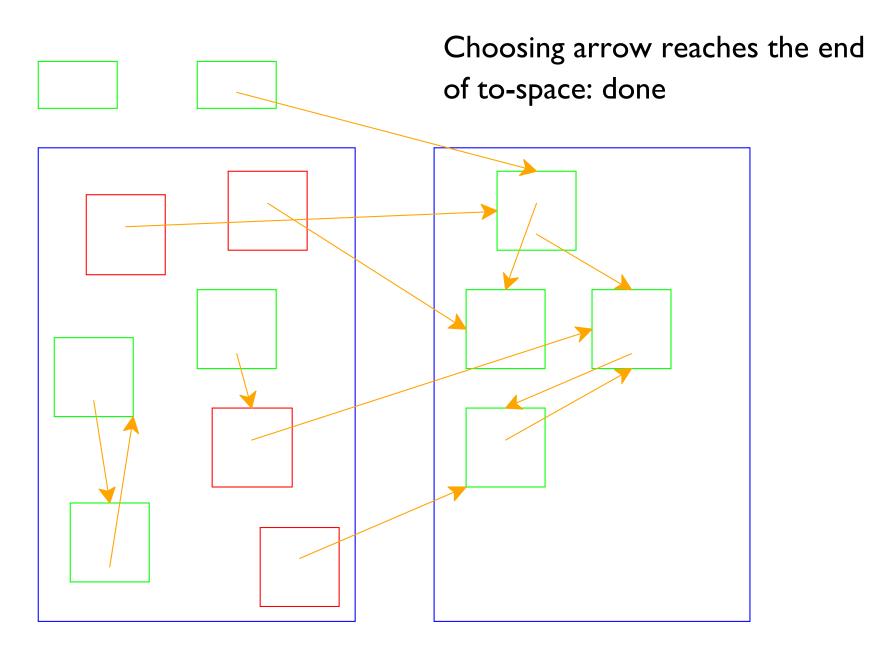

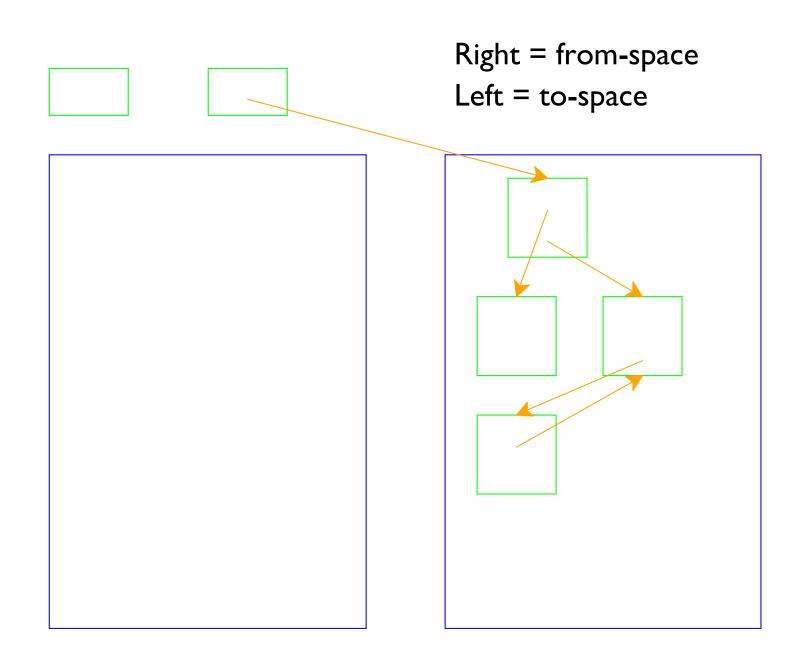

#### Two-Space Collection on Vectors

- Everything is a number:
  - Some numbers are immediate integers
  - Some numbers are pointers
- An allocated record in memory starts with a tag, followed by a sequence of pointers and immediate integers
  - The tag describes the shape

- 26-byte memory (13 bytes for each space), 2 registers
  - Tag I: one integer
  - Tag 2: one pointer
  - Tag 3: one integer, then one pointer

Register I: 7 Register 2: 0

From: 1 75 2 0 3 2 10 3 2 2 3 1 4

- 26-byte memory (13 bytes for each space), 2 registers
  - Tag I: one integer
  - Tag 2: one pointer
  - Tag 3: one integer, then one pointer

Register 1: 7 Register 2: 0

From: 1 75 2 0 3 2 10 3 2 2 3 1 4

Addr: 00 01 02 03 04 05 06 07 08 09 10 11 12

- 26-byte memory (13 bytes for each space), 2 registers
  - Tag I: one integer
  - Tag 2: one pointer
  - Tag 3: one integer, then one pointer

```
Register I: 7 Register 2: 0

From: 1 75 2 0 3 2 10 3 2 2 3 1 4

Addr: 00 01 02 03 04 05 06 07 08 09 10 11 12
```

- 26-byte memory (13 bytes for each space), 2 registers
  - Tag I: one integer
  - Tag 2: one pointer
  - Tag 3: one integer, then one pointer

	Register 1: 7 Register 2: 0												
From:	1	75	2	0	3	2	10	3	2	2	3	1	4
Addr:	00	01	02	03	04	05	06	07	80	09	10	11	12
	^		^		^			^			^		
To:	0	0	0	0	0	0	0	0	0	0	0	0	0
	^												

- 26-byte memory (13 bytes for each space), 2 registers
  - Tag I: one integer
  - Tag 2: one pointer
  - Tag 3: one integer, then one pointer

From:		R	egist	ter I	: 0		Re						
	1	75	2	0	3	2	10	99	0	2	3	1	4
Addr:	00	01	02	03	04	05	06	07	80	09	10	11	12
	^		^		^			^			^		
То:	3	2	2	0	0	0	0	0	0	0	0	0	0

- 26-byte memory (13 bytes for each space), 2 registers
  - Tag I: one integer
  - Tag 2: one pointer
  - Tag 3: one integer, then one pointer

- 26-byte memory (13 bytes for each space), 2 registers
  - Tag I: one integer
  - Tag 2: one pointer
  - Tag 3: one integer, then one pointer

- 26-byte memory (13 bytes for each space), 2 registers
  - Tag I: one integer
