# Notes: Bernoulli, Binomial, and Geometric Distributions

CS 3130/ECE 3530: Probability and Statistics for Engineers

September 19, 2017

**Bernoulli distribution:**
Defined by the following pmf:

$$p_X(1) = p, \quad \text{and} \quad p_X(0) = 1 - p$$

Don't let the $p$ confuse you, it is a single number between 0 and 1, not a probability function. If $X$ is a random variable with this pmf, we say "$X$ is a Bernoulli random variable with parameter $p$", or we use the notation $X \sim Ber(p)$. You can think of a Bernoulli trial as flipping a coin where the chance of heads is $p$ and the chance of tails is $1-p$. Often we call $0$ a "failure" and $1$ a "success", so $p$ is the probability of success.

**Binomial distribution:**
The binomial distribution describes the probabilities for repeated Bernoulli trials – such as flipping a coin ten times in a row. Each trial is assumed to be independent of the others (for example, flipping a coin once does not affect any of the outcomes for future flips). First, we need some definitions.

Remember the definition for factorial:

$$n! = n \times (n-1) \times \cdots \times 2 \times 1$$

This is the number of ways to put $n$ objects into a specific order.

And the definition for "$n$ choose $k$":

$$\binom{n}{k} = \frac{n!}{(n-k)!\,k!}$$

This is the number of ways to select $k$ objects out of a possible $n$, where the order does *not* matter.

The **binomial distribution** with parameters $n$ and $p$ is given by the pmf:

$$p_X(k) = \binom{n}{k} p^k (1-p)^{n-k}.$$

This is denoted $X \sim Bin(n, p)$. This distribution is for repeated Bernoulli trials, and it gives the probability that you get $k$ successes out of $n$ trials.

**Geometric distribution:**
The **geometric distribution** is also for repeated Bernoulli trials, and it gives the probability that the first $k-1$ trials are failures, while the $k$th trial is the first success. Its pmf is

$$p_X(k) = (1-p)^{k-1}\, p.$$

This is denoted $X \sim Geo(p)$.

In-class Problem: Remember the Monty Hall problem – if we switch doors, we have a 2/3 chance of winning and 1/3 chance to lose. If we play the game 4 times, what is the probability that we win exactly once? How about exactly 0, 2, 3, or 4 times? What is the chance that we loose the first three times and finally win on the 4th try?

**Key to variable names**

It's important to keep straight what all the variables mean in the above equations. Here is a summary:

$n$ : Number of trials
$k$ : Number of successes in Binomial, OR first success that occurs in Geometric
$p$ : Probability of success
