

Mobile Application Programming: Android

Media Sensors

45% LESS FAT

3 Musketeers

Whipped Up. Fluffy Chocolate-on-Chocolate Taste

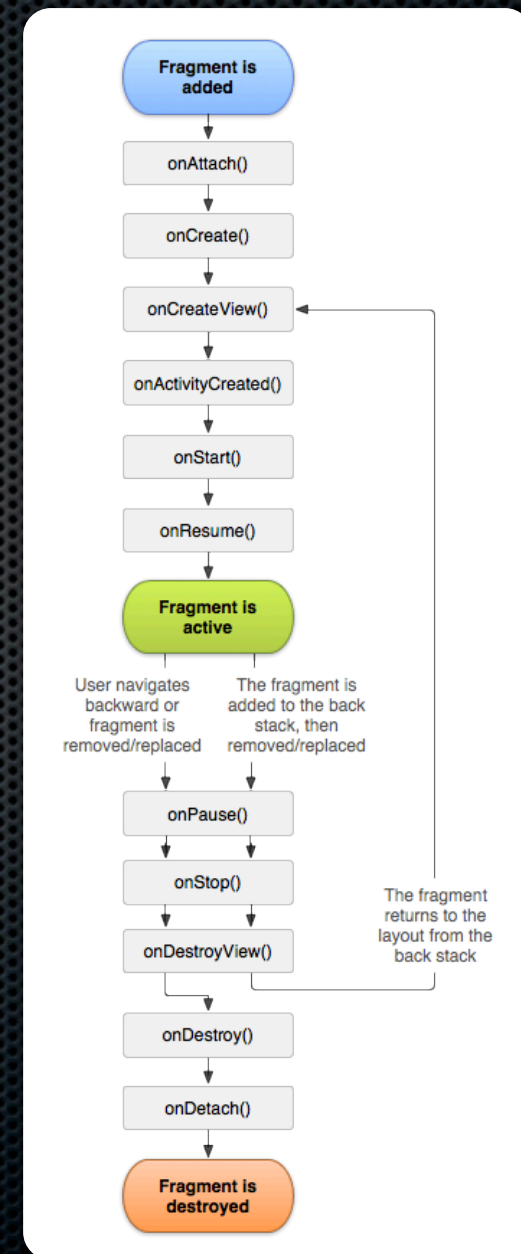

Activities

- ❖ Apps are **composed of activities**
- ❖ Activities are self-contained tasks made up of **one screen-full** of information
- ❖ Activities **start one another** and are **destroyed commonly**
- ❖ Apps can **use activities belonging to another app**

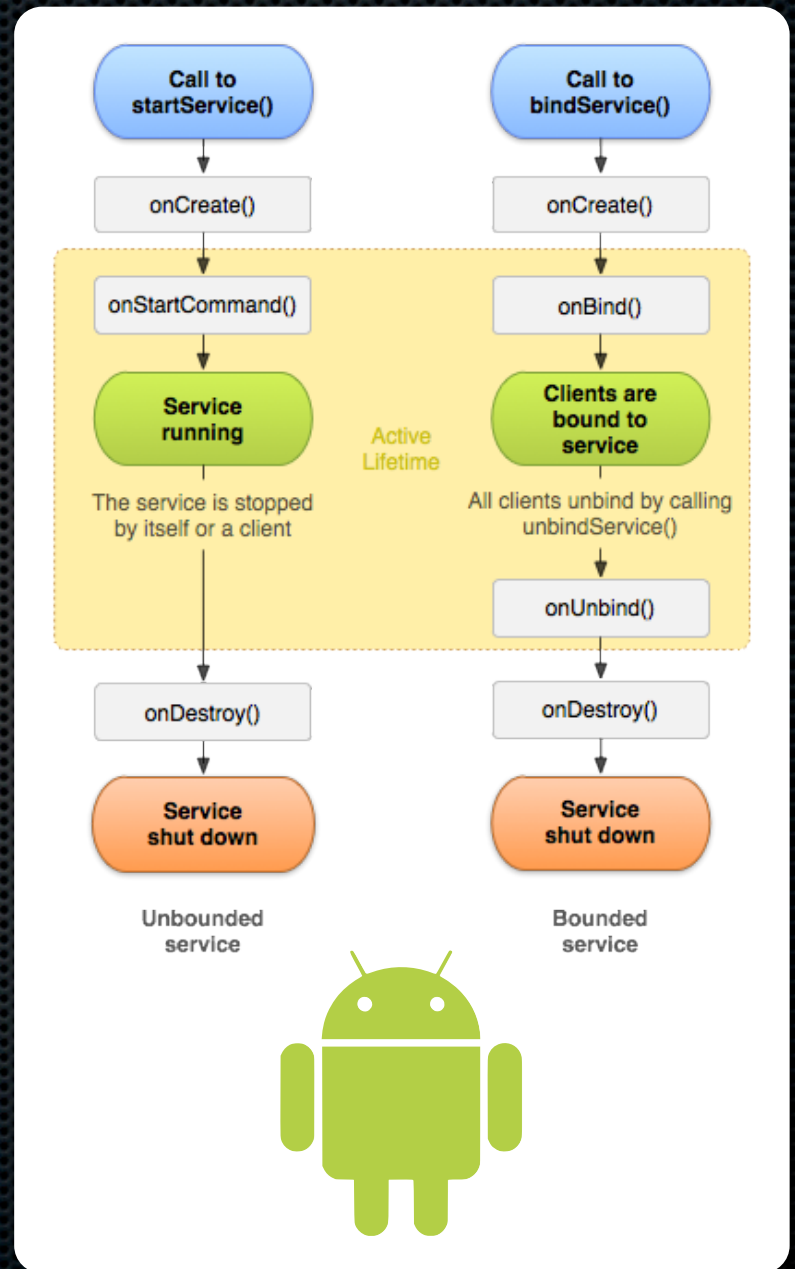

Fragments

- ❖ Acts like a **sub-activity**
- ❖ Attached and removed from an activity using the **FragmentManager**
- ❖ Attachment or removal of many fragments with **FragmentManager**
- ❖ Lifecycle **tied to parent** activity
- ❖ Adds `onAttach / onDetach` and `onCreateView / onDestroyView`

Services

- ❖ An application component that can perform **long-running operations in the background** and **does not provide a user interface**.
- ❖ Can be **started and potentially run indefinitely** or be **bound to** and run until the operation the service provides is no longer needed.
- ❖ Apps can **use services belonging to another app**
- ❖ Can be **unbound or bound**

Camera

- ❖ Camera interaction can be accomplished through **another application** or by **direct interaction** with the camera hardware
- ❖ **Another application** can be launched to capture image data by using an **intent action**
- ❖ **Direct interaction** is performed by using the **Camera** class in the android.hardware package

Camera

- An application activity capable of capturing images can be started by using the **intent action**:
 - `MediaStore.ACTION_IMAGE_CAPTURE`
- Camera applications return image **thumbnails** if invoked using `startActivityForResult`
 - See the returned intent's "**data**" extra
- Capturing a **full image** requires that a URI be provided in the `MediaStore.EXTRA_OUTPUT` key of the intent
- The full image **can be then read** from that URI in `onActivityResult`

Video

- An application activity capable of capturing videos can be started by using the **intent action**:
 - `MediaStore.ACTION_VIDEO_CAPTURE`
- Camera applications return **video URI** if invoked using `startActivityForResult`
 - See the returned intent's **data property** (not the “data” extra)
- **Capture options** can be passed to activity using extras and keys defined by the `MediaStore` class
- The video **can be then read** from that URI and manipulated

Audio

- ✦ The **MediaPlayer** class is used for both **simple** and **advanced** audio input / output
- ✦ Allows **fine-tuned** playback options and streaming
- ✦ For full-featured playback, run as a **foreground service**
- ✦ See **Media Playback Guide** for more information
 - ✦ <http://developer.android.com/guide/topics/media/mediaplayer.html>

Audio Recording

- The **MediaRecorder** class is used for recording of audio
- Need to set **audio source**, **output format**, **output file**, and **audio encoder**, then call **prepare**
- `MediaRecorder.AudioSource.MIC` is typical source, use constants from the `MediaRecorder` class to fill in rest
- Calling **start** and **stop** adds to recording, saving to the provided file as recording progresses
- Call **release** when finished to free resources and close audio file

OpenAL

- ✦ Available from NDK as OpenSL
- ✦ 3D sound source with output positioning and Doppler Effect
- ✦ Audio Device
- ✦ Audio Context
- ✦ Sound Listener
- ✦ Sound Source
- ✦ Sound Buffer
