Hydrogel anti-fog coatings work well in preventing fogging. Lenses.

Because nitrogen is electronegative, electrostatic forces cause the structure to swell or contract when ions are absorbed.

The design process required many iterations and extensive testing.

The new anti-fog coating performed similarly to commercial material in both the anti-fog and transparency tests.

The design team would like to thank Taylor Sparks and Jeff Bates for providing their guidance and expertise. The team would also like to thank Ken Barfield of DFG, Inc. for providing support throughout the project.
